PROFESSIONAL SUMMARY

Motivated Junior Flutter Developer with a solid foundation in Dart, object-oriented programming, and clean application architecture. Skilled in BLoC/Cubit state management, RESTful API integration, and local data persistence, with a strong focus on scalable, maintainable, well-structured code. Passionate about intuitive user experiences backed by robust error handling, localization, and dark mode support. A fast learner and independent problem-solver, comfortable with modern Git/GitHub workflows.

EDUCATION

Nahda University — B.Sc. in Computer Science (Third Year, Expected Graduation 2028)

GPA: 2.93 / 4.00

TECHNICAL SKILLS

Programming Languages: Dart, C++, Python

Mobile Development: Flutter (Dart)

State Management: BLoC, Cubit

Architecture: Clean Architecture, OOP Principles

APIs & Backend: RESTful APIs, Dio, HTTP, JSON Parsing

Local Storage: Local Persistence (Hive/Shared Preferences), Local Notifications

Tools & Platforms: Git, GitHub, Android Studio, Visual Studio Code

Other: Data Structures, UI/UX Implementation, Localization (Arabic/English), Dark Mode, Error Handling

PROJECTS

TaskFlow — Flutter Productivity & Task Management App

Personal Project | [GitHub](#)

- Engineered a modular Flutter productivity application using BLoC/Cubit state management to separate business logic from the UI layer.
- Implemented full task lifecycle tracking (Pending, Completed, Overdue) with time-based validation rules and automated local notifications for overdue alerts.
- Built local data persistence to support offline functionality without requiring a backend server.
- Integrated in-app analytics/statistics, full Arabic/English localization, and cross-screen Dark Mode support.

Technologies: Flutter, Dart, BLoC/Cubit, Local Storage, Local Notifications, Localization, Clean Architecture

Weather App — Real-Time Weather Forecast Application

Personal Project | [GitHub](#)

- Developed a Flutter application consuming third-party REST APIs to display real-time weather metrics and forecasts.
- Applied BLoC/Cubit pattern to manage application states and parse raw JSON responses into strongly-typed Dart data models.
- Handled edge cases by implementing UI state management for loading, success, error, and empty search results to ensure graceful degradation during network issues.

Technologies: Flutter, Dart, REST APIs, BLoC/Cubit, Dio/HTTP, JSON Parsing, Error Handling

CERTIFICATIONS & TRAINING

- Google AI Essentials Specialization — Google
- Introduction to Software Engineering — IBM
- Introduction to Dart — Google Cloud
- Introduction to Mobile App Development — IBM
- Foundations of User Experience (UX) Design — Google
- Programming for Everyone: Getting Started with Python — University of Michigan

LANGUAGES

Arabic — Native | English — Professional Working Proficiency
